Intel® N2800 Development Board Support Package for Windows® Embedded Standard 7

By Sean D. Liming / Owner / SJJ Embedded Micro Solutions

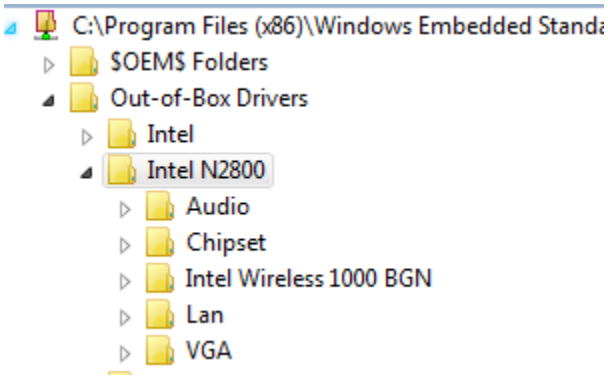

March 2012

The Intel® N2800 Development Board is the latest Intel® Atom™ development board. The N2800 is unique that it has 2 cores with hyper threading. This WES7 support package includes 32-bit drivers for the following peripherals:

- Intel® Graphics Media Accelerator 3600
- Intel® Ethernet Drivers
- Intel® Wireless 1000 BGN drivers
- Audio Drivers

Warning! The package is an example only, and the drivers supplied might not be the latest drivers available. Please see the board manufacture for any updates.

The drivers are place in the Out-of-Box Drivers folder for 32-bit distribution share. In the root of the folder is a PMQ file that was generated by TAP.EXE.

Support Package Driver Contents

1. Copy the folders in the Out-of-Box Drivers folder to the corresponding folder the 32-bit distribution share. The PMQ files should be placed someone else in your file system.
2. Open Image Configuration Editor (ICE).
3. Open the distributions share.
4. Create a new answer file.
5. Select **File->Import->Import PMQ…** to import the **devices.pmq**.
6. Under Out-of-Box Drivers, right-click on **Intel N2800** and select **Insert Driver Path to Pass 2 offlineServicing**.
7. Add any other packages and drivers to your answer file. You could add the Application Compatibility template. This template will pull in the packages to create a full Windows® 7 compatible OS. Ideal for testing functionality, but not recommended as a final image.
8. Validate the answer file.
9. Build an IBW disk using the answer file, and copy the image to a bootable USB flash disk.
10. Boot and install the WES7 image on the Intel EDB.
